

Electronic pressure sensors

OsiSense XM

For control circuits

Functions

Pressure transmitters

The function of pressure transmitters is the control and measurement of pressure or vacuum levels in hydraulic or pneumatic systems.

They transform the pressure into an electrical signal which is proportional to the pressure measured.

Their high precision makes them suitable for all industrial applications requiring pressure/vacuum display, control or regulation.

Being very robust, they are equally suitable for applications involving high operating rates.

Pressure and vacuum switches

The function of electronic pressure and vacuum switches is the control or regulation of pressure or vacuum levels in hydraulic or pneumatic systems.

They transform the pressure change into a digital output signal when the preset pressure or vacuum points are reached. The very wide adjustment range for the setting points characterise these electronic switches.

Their robustness, together with their excellent adherence to the set values over a period of time, make them ideal for applications involving high operating rates.

In addition, the high repeat accuracy and fast response time of these sensors make them equally suitable for applications requiring accurate pressure regulation and monitoring.

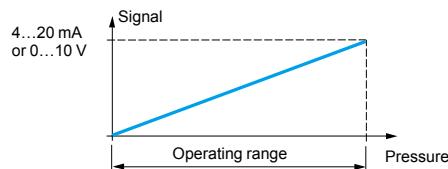

Universal sensors

Universal sensors are electronic pressure and vacuum switches which include an analogue output, identical to that of the pressure transmitters.

Operating principle

Pressure transmitters

The electrical signal from the pressure transmitter (signal proportional to the pressure being monitored) is amplified, calibrated and output as a standard 4 to 20 mA or 0 to 10 V (depending on model) analogue signal.

Pressure and vacuum switches

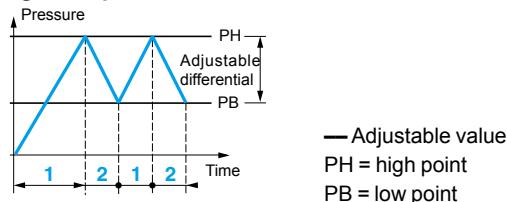

Designed for regulation between 2 thresholds (adjustable differential), these switches have both a high point setting (PH) and a low point setting (PB). Both of these points can be independently adjusted.

The difference (differential) between the two setting points can be little or considerable, thus enabling small or large differentials to be set.

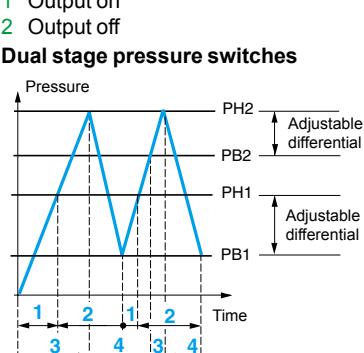

Being electronic, the switches have no mechanical moving parts.

Operating principle with solid-state NC outputs

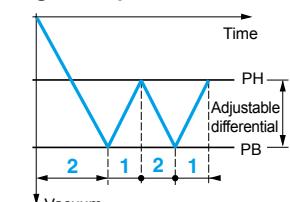

Pressure switches with digital output

Dual stage pressure switches

Vacuum switches with digital output

- Adjustable value
- PH = high point 1st stage
- PB = low point 1st stage
- PH2 = high point 2nd stage
- PB2 = low point 2nd stage
- 1 Output 1st stage on
- 2 Output 1st stage off
- 3 Output 2nd stage on
- 4 Output 2nd stage off

Terminology

Measuring range

The measuring range (MR) of a pressure sensor corresponds to the difference between the upper and lower values measured by the load cell. It is comprised between 0 bar and the pressure corresponding to the size of the sensor.

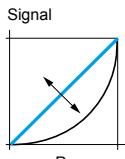

Operating range

The **operating range of a pressure transmitter** corresponds to its measuring range. Within this range, its analogue output signal varies between 4 and 20 mA or 0 and 10 V and is proportional to the measured pressure.

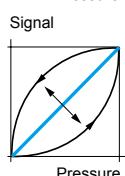

The **operating range of a pressure or vacuum switch** is the difference between the minimum low point (PB) and the maximum high point (PH) setting values.

Precision

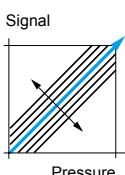

This comprises linearity, hysteresis, repeat accuracy and setting tolerances. It is expressed as a % of the measuring range (MR) of the load cell (% MR).

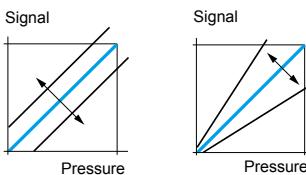

The linearity is the maximum deviation between the real transmitted curve and the ideal curve.

The hysteresis is the maximum deviation between the rising pressure curve and the falling pressure curve.

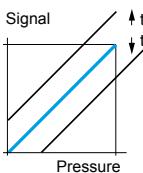

The repeat accuracy is the maximum drift encountered at varying pressures under given conditions.

The setting tolerances are the manufacturer's tolerances regarding the zero point and sensitivity (gradient of output signal curve from the pressure transmitter).

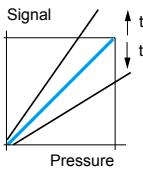

Temperature drift

The precision of a pressure sensor is always susceptible to variation due to the operating temperature.

Zero point drift

This is proportional to the temperature and is expressed as % MR/°C.

Sensitivity drift

This is proportional to the temperature and is expressed as % MR/°C.

Terminology (continued)

Switching point on rising pressure (PH)

The upper pressure setting at which the output of the electronic pressure or vacuum switch changes state on rising pressure.

Switching point on falling pressure (PB)

The lower pressure setting at which the output of the electronic pressure or vacuum switch changes state on falling pressure.

Differential

The difference between the switching point on rising pressure (PH) and the switching point on falling pressure (PB). The low point can be set at the values indicated on the operating curves shown on the product pages.

Repeat accuracy

The variation of the operating point of the pressure or vacuum switch between several successive operations.

Size

Pressure transmitters and pressure switches

This is the maximum value of the operating range.

Vacuum transmitters and vacuum switches

This is the minimum value of the operating range.

Maximum permissible accidental pressure

The maximum pressure (excluding pressure surges) that the sensor can occasionally withstand without permanent damage.

Destruction pressure

The pressure value which if exceeded is likely to cause serious damage to the sensor, i.e. leaking, bursting, component failure, etc.

Load resistance of pressure transmitters

The supply voltage and load resistance of a pressure transmitter must be selected according to the formula:

$$R_{\text{load}} = \frac{U_{\text{supply}} - U_{\text{supply min.}}}{0.02 \text{ A}}$$

Features of pressure sensors XML F

Pressure sensors type XML F (see page 2/42) feature numerous configuration possibilities with regards to the display (response time, choice of bar or psi units of measurement), analogue output signal operation (maximum signal output adjustable between 75% and 125% of the units size), solid-state output operation (PNP or NPN, NO or NC, time delay on opening or on closing, response time) and status signalling (see below).

A diagnostic function is incorporated which enables verification, at any time, of the sensors correct operation (see below) and also, to provide information regarding pressure peak values.

Self-test function (calibration shunt)

All pressure sensors XML F incorporate a diagnostic function which can be used, at any time, to check the correct operation of the unit. It comprises an internal system which enables automatic monitoring of all the sensor circuits, including the ceramic pressure measuring load cell.

For all models, this function is manually activated and the result of the test is indicated on the display (DONE or ERR).

For pressure transmitters, this function can also be remotely activated via a digital input connected to a PLC, thus enabling automatic verification without the need of intervention by an operator. In this instance, the self-test also generates an analogue output signal which is equivalent to 50% of the sensors size (12 mA or 5 V) which, in turn, can be verified by the PLC.

The unit can be considered as defective if the difference between the signal transmitted and the standard theoretical value is too great.

Operational status signalling

Pressure and vacuum switches XML F feature status LED indicators for the digital outputs. Indication can be configured for 2 modes:

- "hysteresis" mode: indicator illuminated when output activated (output off for NC configuration or output on for NO configuration).
- "window" mode: indicator illuminated when the pressure being measured is between the high and low set point values.

Selection of switch size

Size selection is made according to the maximum pressure of the system to be controlled.

Adherence to pressure

Select a size whereby the nominal pressure is higher than the maximum pressure of the system to be controlled.

Precision, repeat accuracy

The precision and repeat accuracy are expressed as a percentage of the measuring range and better detection is achieved when the size of the sensor is close to that of the maximum pressure of the system to be controlled. As a general rule, avoid working towards the bottom limit of the measuring range.

Minimum differential of a pressure or vacuum switch

The minimum differential for each switch size is 2% for XML E and 3% for XML F of its operating range.

Selection example for a pressure switch

Maximum pressure of system = 11 bar

PH = 7 bar

PB = 6 bar

2 alternative choices:

XML •010•••• (10 bar) or

XML •025•••• (25 bar)

Advantages:

XML •010••••: maximum repeat accuracy and precision

XML •025••••: withstand to overpressure.

Electromechanical pressure and vacuum switches

OsiSense XM

For control circuits, type XML

Presentation

Pressure and vacuum switches type **XML** are switches for control circuits. They are used to control the pressure of hydraulic oils, fresh water, sea water, air, steam, corrosive fluids or viscous products, up to 500 bar.

XML A pressure and vacuum switches have a fixed differential and are for detection of a single threshold. They incorporate a 1 CO single-pole contact.

XML B pressure and vacuum switches have an adjustable differential and are for regulation between 2 thresholds. They incorporate a 1 CO single-pole contact.

XML C pressure and vacuum switches have an adjustable differential and are for regulation between 2 thresholds. They incorporate 2 CO single-pole contacts.

XML D pressure and vacuum switches are dual stage switches, each stage with a fixed differential, and are for detection at each threshold. They incorporate 2 CO single-pole contacts (one per stage).

Setting

When setting pressure and vacuum switches XML, adjust the switching point on rising pressure (PH) first and then the switching point on falling pressure (PB).

Pressure and vacuum switches with fixed differential, type XML A

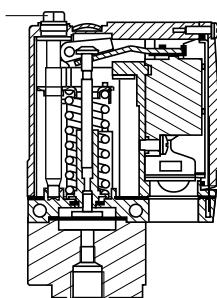

Switching point on rising pressure

The switching point on rising pressure (PH) is set by adjusting the red screw **1**.

Switching point on falling pressure

The switching point on falling pressure (PB) is not adjustable.

The difference between the tripping and resetting points of the contact is the natural differential of the switch (contact differential, friction, etc.).

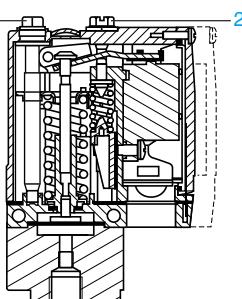

Pressure and vacuum switches with adjustable differential, types XML B and XML C

Switching point on rising pressure

The switching point on rising pressure (PH) is set by adjusting the red screw **1**.

Switching point on falling pressure

The switching point on falling pressure (PB) is set by adjusting the green screw **2**.

Dual stage pressure and vacuum switches with fixed differential for each threshold, type XML D

Switching point on rising pressure of stage 1 and stage 2

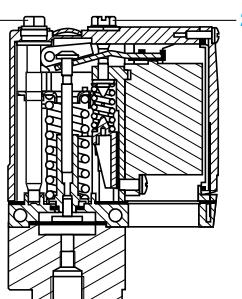

The first stage switching point on rising pressure (PH1) is set by adjusting the red screw **1**.

The second stage switching point on rising pressure (PH2) is set by adjusting the blue screw **2**.

Switching point on falling pressure

The switching points on falling pressure (PB1 and PB2) are not adjustable.

The difference between the tripping and resetting points of each contact is the natural differential of the switch (contact differential, friction, etc.).

Environment characteristics

Conformity to standards		CE, IEC/EN 60947-5-1, UL 508, CSA C22-2 n° 14
Product certifications		UL, CSA, CCC, BV, LROS, RINA, GL, DNV, VIT-SEPRO
Protective treatment		Standard version "TC". Special version "TH"
Ambient air temperature	°C	For operation: - 25...+ 70. For storage: - 40...+ 70
Fluids or products controlled		Hydraulic oils, air, fresh water, sea water (0...+ 160°C), depending on model Steam, corrosive fluids, viscous products (0...+ 160°C), depending on model
Materials		Case: zinc alloy Component materials in contact with fluid: see pages 2/136 and 2/137
Operating position		All positions
Vibration resistance		4 gn (30...500 Hz) conforming to IEC 68-2-6 except XML •L35•••••, XML •001••••• and XML BM03•••••: 2 gn
Shock resistance		50 gn conforming to IEC 68-2-27 except XML •L35•••••, XML •001••••• and XML BM03•••••: 30 gn
Electric shock protection		Class I conforming to IEC 1140, IEC 536 and NF C 20-030
Degree of protection		Screw terminal models: IP 66 conforming to IEC/EN 60529 Connector models: IP 65 conforming to IEC/EN 60529
Operating rate	Op. cycles/min	Piston version switches: ≤ 60 (for temperature > 0°C) Diaphragm version switches: ≤ 120 (for temperature > 0°C)
Repeat accuracy		< 2%
Fluid connection		G 1/4 (BSP female) conforming to NF E 03-005, ISO 228 or 1/4" NPTF (consult our Customer Care Centre)
Electrical connection		Screw terminal models: ISO M20 x 1.5 tapped entry For an entry tapped for n° 13 (DIN Pg 13.5) cable gland, replace the last number of the reference by 1 (example: XML A010A2S12 becomes XML A010A2S11) For an entry tapped 1/2" NPT, please consult our Customer Care Centre Connector models (either type DIN 43650 A or M12): please consult our Customer Care Centre

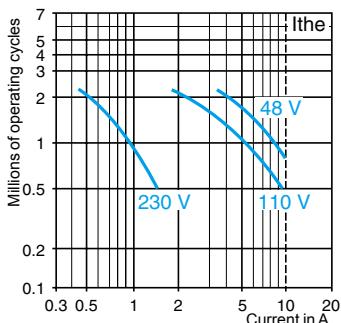

Contact block characteristics

Rated operational characteristics		~ AC-15; B300 (Ue = 240 V, Ie = 1.5 A - Ue = 120 V, Ie = 3 A) --- DC-13; R300 (Ue = 250 V, Ie = 0.1 A) conforming to IEC 947-5-1 Appendix A, EN 60 947-5-1
Rated insulation voltage		Ui = 500 V conforming to IEC/EN 60947-1 Ui = 300 V conforming to UL 508, CSA C22-2 n° 14
Rated impulse withstand voltage		U imp = 6 kV conforming to IEC/EN 60947-1
Type of contacts		Silver tipped contacts XML A and XML B : 1 CO single-pole contact (4 terminal), snap action XML C : 2 CO single-pole contacts (8 terminal), simultaneous, snap action XML D : 2 CO single-pole contacts (8 terminal), staggered, snap action
Resistance across terminals	mΩ	< 25 conforming to NF C 93-050 method A or IEC 255-7 category 3
Terminal referencing		Conforming to CENELEC EN 50013
Short-circuit protection		10 A cartridge fuse type gG (gl)
Connection		Screw clamp terminals. Minimum clamping capacity: 1 x 0.2 mm², max: 2 x 2.5 mm²

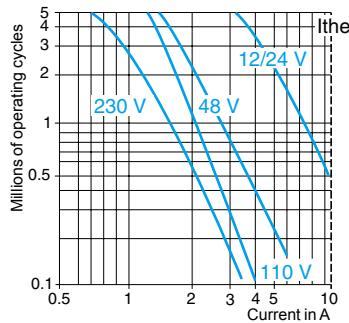

Electrical durability
Conforming to IEC/EN 60947-5-1 Appendix C
Utilisation categories AC-15 and DC-13

Operating rate: 3600 operating cycles/hour
Load factor: 0.5

XML A and XML B
AC supply ~ 50/60 Hz
--- Inductive circuit, Ithe = 10 A

XML C and XML D
AC supply ~ 50/60 Hz
--- Inductive circuit, Ithe = 10 A

DC supply ---
Power broken in W
for 1 million operating cycles

Voltage V	24	48	120
mm W	31	29	26

DC supply ---
Power broken in W
for 5 million operating cycles

Voltage V	24	48	120
mm W	10	7	4

Complementary characteristics not shown under general characteristics (page 2/77)

Possible differential (subtract from PH to give PB)	Min. at low setting (3)	0.45 bar (6.53 psi)	0.25 bar (3.62 psi)
	Min. at high setting (4)	0.70 bar (10.15 psi)	0.65 bar (9.42 psi)
	Max. at high setting	8 bar (116 psi)	5.6 bar (81.2 psi)
Maximum permissible pressure	Per cycle	12.5 bar (181.25 psi)	30 bar (435 psi)
	Accidental	22.5 bar (326.25 psi)	37.5 bar (543.75 psi)
Destruction pressure		45 bar (652.5 psi)	67.5 bar (978.75 psi)
Mechanical life		5 x 10 ⁶ operating cycles	2 x 10 ⁶ operating cycles
Cable entry for terminal models		1 entry tapped M20 x 1.5 mm for ISO cable gland, clamping capacity 7 to 13 mm	
Pressure switch type	Diaphragm		

(1) For 1 entry tapped for n° 13 cable gland, replace S12 by S11 (example: XML C010B2S12 becomes XML C010B2S11).

(2) Component materials of units in contact with the fluid, see pages 2/136 and 2/137.

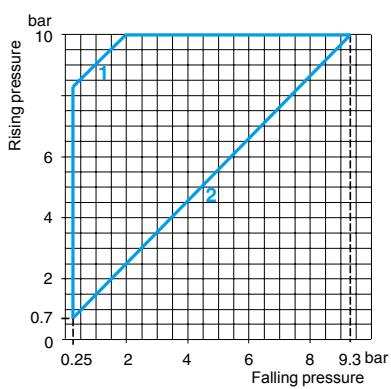

(3) Deviation of the differential at low setting point for switches of the same size: ± 0.05 bar
(± 0.72 psi).

(4) Deviation of the differential at high setting point for switches of the same size: ± 0.01 bar
(± 1.45 psi).

(1) Depending on required adjustment range, examples: pressure < 8 bar = XML A/B/C010, pressure > 8 bar = XML A/B/C020.

(2) Depending on required adjustment range, examples: pressure < 18 bar = XML A/B/C020, pressure > 18 bar = XML A/B/C035.

(3) Depending on required adjustment range, examples: pressure < 32 bar = XML A/B/C035, pressure > 32 bar = XML A/B/C070.

(4) Depending on fluid to be controlled.

(5) Depending on required adjustment range, examples: pressure < 65 bar = XML A/B/C070, pressure > 65 bar = XML A/B/C160.

(6) Depending on required adjustment range, examples: pressure < 18 bar = XML A/B/C020, pressure > 18 bar = XML A/B/C035.

(7) Temperature of fluid to be controlled limited to 70°C

(8) Please consult our Customer Care Centre.

Component materials of units in contact with fluid

This information will assist in checking the corrosion resistance of the pressure or vacuum switches in relation to the fluids controlled
